1. Opis

Zadaniem było napisanie gry snake wykorzystując, watki. Gra miała zawierac niezbędne elementy, ruchomy owoc, owoce, dwóch graczy ai, gracza glownego menu, i histore wynikow.

Wykonanie i plan

Wykonalem powyższe zadanie jednak ograniczyłem sterowanie watkami do kybierania kierunku.

Dodatkowo w poniższym kodzie probowalem niestety bezskutesznie zaimplementować synchronizację- jest to watek uruchamiany i dzialajacy ciagle oraz co 100ms ustawiający odpowiednio kierunek ruchu weza.

```
private void runAl(List<Point> snakeAl, boolean isFirstAl){
  while (true) {
    synchronized (lock){
    if(isFirstAl){
      while (que!=1) {
      try { lock.wait(); } catch (InterruptedException e) {}
    }
}
```

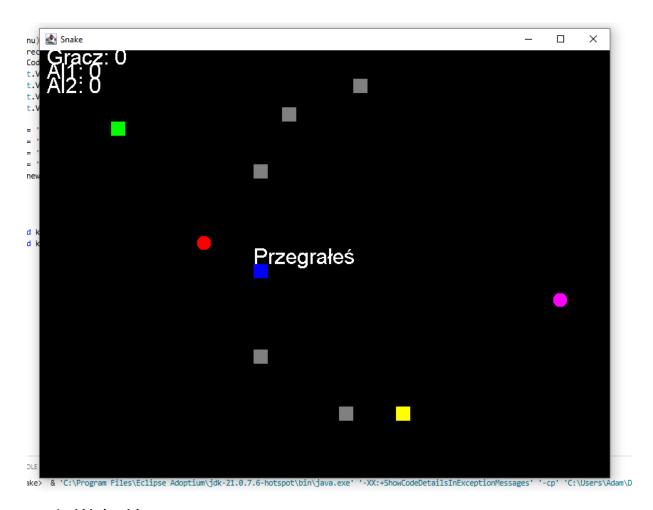

```
}
if(!isFirstAI){
     while (que != 2) {
     try \{ lock.wait(); \} catch (InterruptedException e) \{ \}
try {
      Thread.sleep(100);
} catch (InterruptedException ignored) {}
 Point head = snakeAl.get(0);
 List < Character > possible Dirs = new ArrayList <> (List.of('U','D','L','R'));
// Odrzucamy kierunek odwrotny
if (isFirstAl) {
     if (direction Al1 == 'U') \ possible Dirs.remove ((Character) \ 'D'); \\
     if (direction Al1 == 'D') possible Dirs.remove ((Character) 'U'); \\
     if (directionAl1 == 'L') possibleDirs.remove((Character) 'R');
     if (directionAl1 == 'R') possibleDirs.remove((Character) 'L');
}else{
     if (direction AI2 == 'U') possible Dirs.remove ((Character) 'D'); \\
     if (direction Al2 == 'D') possible Dirs.remove ((Character) 'U'); \\
     if (directionAl2 == 'L') possibleDirs.remove((Character) 'R');
     if (directionAl2 == 'R') possibleDirs.remove((Character) 'L');
 // Logika ustawiania nowego kierunku
 if (food != null) {
     possibleDirs.sort((dir1, dir2) -> {
     Point next1 = nextPoint(head, dir1);
     Point next2 = nextPoint(head, dir2);
     int distance1 = Math.abs(next1.x - food.x) + Math.abs(next1.y - food.y);
     int distance2 = Math.abs(next2.x - food.x) + Math.abs(next2.y - food.y);
     return Integer.compare(distance1, distance2);
 });
 for (char candidate : possibleDirs) {
     Point nextHead = nextPoint(head, candidate);
     if (!isPointCollision (nextHead, snakeAI, snakeAI1, snakeAI2) \&\& !obstacles.contains (nextHead)) \{ in the contains (nextHead) \} (in the contains (nextHead)) \} (in the contains (nextHea
         if (isFirstAI) {
              directionAl1 = candidate;
             directionAl2 = candidate;
         }
          break;
```

```
